Aurevix — Demo Video Script & Production Guide

For the website hero and for business partners. Includes the recommended length (with reasoning), which features to show vs. cut, a timecoded script, and an optional extended cut.

---

1. How long should the video be? (the short answer + the reasoning)

Recommendation: make one 75–90 second "hero" cut, engineered so the first ~30 seconds deliver the full "wow." Optionally produce a 2.5–3 minute "deep-dive" cut for partners and sales calls, linked *below* the hero — never as the hero itself.

Why not your current 3–4 minutes for the hero: - On a website, viewer attention falls off a cliff after about 60–90 seconds. A 3–4 minute hero loses most of the audience before the point lands. - Your own brand promise is literally **"See it work in 30 seconds."** The hero video should *honor that promise* — if the headline says 30 seconds and the video runs four minutes, you undercut your own claim. - One video can't be optimal for two very different audiences. A cold website visitor needs the *wow* fast; an integrator-partner needs *proof of depth*. Solve this with **two cuts**, not one compromise.

Why 75–90 seconds is the sweet spot for the hero: - Long enough to show the magic *and* the three reasons to believe (multi-brand, ownership/no per-task fee, safety gating) *and* an ROI beat *and* a CTA. - Short enough that a cold visitor watches to the end. - The first 30 seconds stand alone as a "30-second" clip you can also use as a social/ad cut.

The two-cut system:

Cut	Length	Audience	Where it lives
Hero cut	75–90s (first 30s = standalone wow)	Cold website visitors, ads, social	Homepage hero, `/demo.mp4`, top of cold emails
Deep-dive cut	2.5–3 min, chaptered	Integrators, OEM partners, warm leads	"Watch the full walkthrough" link under the hero, sales decks, partner page

---

2. What to show — and what to deliberately cut

The instinct is to show everything. Resist it. The hero shows the **transformation and the reasons to believe**; the deep-dive shows the **proof of depth**.

Feature	Hero (75–90s)	Deep-dive (2.5–3m)	Why
Phone video → robot running (the magic)	✅ Lead with it	✅	This *is* the product. It must open the hero.
Intent extraction ("found 5 task stages")	✅	✅	Shows it *understands*, not just records.

Feature	Hero (75–90s)	Deep-dive (2.5–3m)	Why
3D simulation / replay	✅ brief	✅ full	"Review before hardware moves" — the trust beat.
Deploy-readiness gating (safety)	✅ one line	✅ explained	Our differentiator; answers "is it safe?"
Multi-brand export (UR/ABB/FANUC…)	✅	✅	The moat and a unique claim.
ROI beat ($ saved / hours not weeks)	✅ one line	✅ calculator shown	Closes the loop on "why care."
Tool-changer (dock/undock)	❌	✅	Proof of depth, not wow.
Gripper config / workcell setup	❌	✅ brief	Too technical for cold visitors.
Execution history table	❌	✅ brief	Operational proof for warm buyers only.
Billing / pricing config	❌	❌	Never in a demo video.
Settings	❌	❌	Irrelevant to the story.

The narrative spine (both cuts): Capture → Understand → Simulate → Deploy → (Own it). This matches your site's own "Capture / Understand / Simulate / Deploy" framing and your "Teach / Deploy / Measure" tabs — keep the language consistent everywhere.

---

3. The hero script (≈85 seconds)

Voiceover written in your brand voice ("Show it once. It runs on repeat." / factory independence / no integrator tax). Claims are **deliberately hedged** to match the careful, safety-aware tone on your site — over-claiming on a robotics product is both off-brand and a liability risk.

> **Format:** `[ON-SCREEN]` = what the viewer sees (use real console + a real cell). `VO:` = voiceover. `TEXT:` = on-screen text/caption (the video must work **muted** — most autoplay is silent).

0:00–0:06 — The hook (the 30-second clip starts here) `[ON-SCREEN]` A worker on a factory floor holds up a phone, filming a simple pick-and-place task. No pendant, no laptop. **TEXT:** *Show it once.* **VO:** "This is all it takes to program a robot now. A phone, and one demonstration."

0:06–0:14 — Intent extraction `[ON-SCREEN]` Cut to the Aurevix console: the uploaded video on the left, "**Aurevix found 5 task stages**," the steps populating (Pick → Rotate → Place → Switch tool → Trigger machine). **TEXT:** *Aurevix understands the task — not just the motion.* **VO:** "Aurevix watches the demonstration and works out the *intent* — what to pick, where to place it, what order, what to wait for."

0:14–0:22 — Simulation (the trust beat) `[ON-SCREEN]` The 3D viewport replays the generated motion smoothly; the "Interpreted intent — Step 1/8" line reads in plain English. **TEXT:** *Review the plan before the hardware moves.* **VO:** "It re-plans that intent for your robot, and you watch the whole thing in simulation — before anything physical moves."

0:22–0:30 — The payoff (end of the standalone 30s clip) `[ON-SCREEN]` Quick cut to a real robot arm executing the same task on a line. Match the motion to the simulation. **TEXT:** *From a video to a running robot — in hours, not weeks*. **VO:** "From a video, to a running robot. In hours — not weeks of integrator time."

0:30–0:42 — Reason to believe #1: multi-brand (the moat) `[ON-SCREEN]` The "Cross-vendor" callout; logos/labels UR · ABB · FANUC · KUKA · Techman · Yaskawa; the "Imported task from UR10e → re-planned for ABB GoFa" record. **TEXT:** *One task. Any robot brand*. **VO:** "Teach it once, and run it on any brand you own — Universal Robots, ABB, FANUC, KUKA, Techman, Yaskawa. Switch robots without starting over."

0:42–0:54 — Reason to believe #2: ownership (the pain) `[ON-SCREEN]` Split visual: an "integrator invoice" struck through vs. the worker confidently editing a task in the console. **TEXT:** *No teach pendant. No code. No per-task invoice*. **VO:** "Every change used to mean calling the integrator, waiting, and paying again. Now your own team owns it — no pendant, no code, no per-task fees."

0:54–1:06 — Reason to believe #3: safety gating `[ON-SCREEN]` The deploy-readiness score with its gate; the "Safety-aware: ISO 10218 / ISO/TS 15066 referenced" and "Human verified: deployment remains gated for review" callouts. **TEXT:** *Built to be checked. Gated for human review.* **VO:** "And it's built for the factory floor — every program is scored for readiness and gated for your team's review and your own safety process. Aurevix assists; it never overrides."

1:06–1:16 — The business case (ROI) `[ON-SCREEN]` The ROI view: "Annual savings per cell" with the figure; "Hours, not weeks." **TEXT:** *See the savings per cell*. **VO:** "The result: programming that took weeks, done in an afternoon — and you can see the savings on every cell."

1:16–1:25 — Close + CTA `[ON-SCREEN]` Clean end card: Aurevix mark, the line "**Show it once. It runs on repeat.**", and the CTA. **TEXT:** *Request a demo with your robot and your task — agenticconvergent.com* **VO:** "Aurevix. Show it once — it runs on repeat. Bring us your robot and your task, and we'll show you live."

---

4. The deep-dive / partner cut (≈2.5–3 min) — what to add

Use the hero as the opening 85 seconds, then add these chapters (chaptered so partners can jump):

1. **Multi-step + conditional logic (≈25s):** show a real sequence with a signal-wait and an IF condition — "machine-tend, wait for the machine's done-signal, then place." Proves it handles *production*, not toy tasks.
2. **Tool-changer (≈25s):** show configuring tool stations once, then Aurevix auto-inserting dock/undock moves when a skill switches from gripper to vacuum cup. This is a "wow" for integrators specifically.
3. **Compatibility (≈20s):** flash the compatibility matrix — robot brands, gripper types (pneumatic/electric/vacuum), export formats (URScript, RAPID, ROS 2, FANUC TP/Karel), ROS 2 / Isaac Sim / I/O integration. Answers "does it fit my stack?"
4. **Code export (≈20s):** show the actual exported native code + PDF report. Integrators trust *seeing* the code, not a black box.
5. **ROI calculator, interactive (≈20s):** adjust an input live; the savings update; "download as PDF." Arms the champion.
6. **Honest boundaries (≈15s):** one calm beat — "Aurevix does not replace your safety PLC, light curtains, or approval workflow." This *builds* trust with serious buyers; it doesn't cost you the sale.

End on the same card + a partner-specific CTA ("Become a design partner").

---

5. Production notes

- **Design for muted autoplay.** Every key claim must appear as on-screen text, because most web/social autoplay is silent. The VO is a bonus, not a dependency.
- **Open on the real-world phone shot, not the UI.** The emotional hook is "a regular worker did this," not "here's our software." Get to the human first, the screen second.
- **Match simulation to reality.** When you cut from the 3D replay (0:14–0:22) to the real robot (0:22–0:30), make the motions visibly match. That cut *is* the proof.
- **Keep claims hedged and specific.** "Hours, not weeks," "for supported robots and workflows," "gated for review." Your site already does this well — the video must match, or it reads as overselling on a safety product.
- **Captions/subtitles** burned in (accessibility + silent autoplay + non-native audiences — you serve DE/US/UK/CN).
- **One CTA only.** "Request a demo." Don't split attention with "design partner" in the *hero* (save that for the deep-dive).
- **Length discipline.** If the hero creeps past 90 seconds, cut a "reason to believe," don't trim the opening 30. The wow earns the watch.

---

6. Quick checklist before you publish

- ☐ First 30 seconds work as a standalone clip (test it muted).
- ☐ Every claim has on-screen text, not just VO.
- ☐ The hero is ≤ 90 seconds; the deep-dive is separate and chaptered.
- ☐ Multi-brand, safety gating, and ownership each get exactly one clear beat.
- ☐ End card has the brand line + a single CTA + the URL.
- ☐ No pricing/settings/config screens in the hero.
- ☐ The "Aurevix assists, never overrides" / safety boundary is present (hero: one line; deep-dive: a full beat).
