Aurevix — Website, SEO & LLM/GEO Playbook

A review of agenticconvergent.com, a keyword/SEO plan, and a generative-engine-optimization (GEO) plan to get Aurevix recommended by ChatGPT, Claude, Perplexity, and Google AI Overviews when buyers ask for solutions like ours.

Part 1 — Website review

Headline: the site is already strong. You have sharp problem framing ("The robot was not the expensive part. The programming was."), a clear Capture→Understand→Simulate→Deploy story, a head-to-head comparison table, a real compatibility matrix, an extensive FAQ, cited sources, and solid meta tags. This is *not* a rebuild — it's gap-filling. Don't break what's working.

The #1 opportunity: stop gating the "wow"

You built a **self-serve interactive demo console** ("Open Console," "See it work in 30 seconds," "Run the 30-second workflow," Safe Demo Mode). But the *marketing site's* only conversion path is **"Request Demo"** — a 45-minute scheduled call. **The magic is locked behind a form.**

This is the single biggest miss. The product's whole promise is "30-second wow," and you have a working demo that delivers it — but a cold visitor can't experience it without booking a sales call. Most won't.

Fix: add a third, frictionless path: **"Try the live demo →"** (the console, in Safe Demo Mode) next to "Request Demo." Let people feel the magic in 30 seconds, *then* ask for the meeting. The funnel becomes: *watch the hero video → try the live console → request a demo / become a design partner.* Three steps of rising commitment instead of one big leap.

Other gaps worth closing

1. **Name the moat on the marketing site.** The site says "switch brands without starting over," but it never names the **Automation Passport** as a concept. Give the cross-vendor portability artifact a name and a section — it's your most defensible idea and it deserves to be a headline, not an implication.
2. **Surface deploy-readiness as a trust feature.** The console's "deploy readiness" gating (below 80% blocked / 80–89% sim review / 90%+ supervised) is a *unique* trust story. The marketing site mentions "ROI Tracking" and "safety-engineer friendly" but doesn't show the readiness-gating concept. Add it — it answers "is it safe?" better than any badge.
3. **Make the ROI calculator a lead magnet.** You have an interactive ROI calculator in the console. Put a version on the marketing site (gated lightly by email, or ungated with a "save/share" that captures email). It arms the internal champion and captures leads who aren't ready for a call.
4. **Design-partner social proof is thin.** "First industrial design partner — machine tool and automation" and "In conversation — warehouse & logistics" are good but anonymous. As partners approve attribution, get a logo, a one-line quote, and a named role on the page. For industrial B2B, *named* proof moves deals.
5. **The console and the site feel like two products.** Visually and in language, tie them together so a visitor understands the console *is* Aurevix. Consistent naming (My Skills / Skill Templates / Task

Records now match — good), consistent visual identity, and a clear "this is the actual product" framing on the demo.

Questions to resolve before the next site iteration ("what should be asked")

- **Is the console safe to expose publicly self-serve?** (Safe Demo Mode suggests yes.) If yes, the gating decision above is easy. If there's a reason it's gated (cost, abuse, data), name it and design around it (e.g., email-gate the console, not the whole experience).
- **What is the single primary conversion goal of the homepage?** Right now it's split between "Request Demo" and "Become a Design Partner." Decide which is primary *for cold traffic* (probably "Try the live demo" → "Request Demo") and make the other secondary.
- **Who is the primary ICP for the site copy — the factory owner/operator, or the integrator/OEM partner?** The current copy serves both, which slightly blurs the message. Consider a clear primary path for each (a "For manufacturers" vs "For integrators/partners" split), since their pains and proof-points differ.
- **What's the data-rights position?** ("Is my data secure?" is answered, but the *training-data* question — do you learn across customers? — will come up with sophisticated buyers and investors. Decide the policy and state it.)
- **Pricing transparency:** "Talk to us" everywhere is fine at design-partner stage, but it adds friction. Decide when you introduce at least a starting price or a clear "what determines price" explainer (you already gesture at this; make it explicit).

Part 2 — SEO plan

You already have a good keyword foundation in your meta tags. The job now is to **organize it by buyer intent**, **fill the gaps**, and **build the comparison/competitor layer** (which is also what LLMs cite — see Part 3).

Keyword map by intent

A. Problem-aware (buyer feels the pain, doesn't know the category yet) — top of funnel, best for the resource/blog hub: - "robot programming cost" / "how much does it cost to program a robot" *(you already have this article — good)* - "robot retasking time" / "why does robot programming take so long" - "robot programming without an engineer" - "labor shortage manufacturing automation" - "low-volume high-mix automation" *(in your meta — keep)* - "integrator cost robot" / "robot integration cost"

B. Solution-aware (buyer knows they want easier programming) — core pages + resources: - "no-code robot programming" / "no-code cobot programming" *(your primary — own it)* - "teach robot by video" / "teach robot from demonstration" *(your differentiator — own it hard)* - "learning from demonstration robotics" - "teach pendant alternative" / "robot programming without teach pendant" *(you have the article — strengthen)* - "program robot from video" - "vision-language-action model robot programming" / "VLA robot programming" *(emerging, you're early — own it)*

C. Brand/product-specific (buyer evaluating a robot brand) — high-intent, build a page per brand: - "Universal Robots programming without code" / "UR no-code" *(you have it)* - "ABB cobot programming software" / "ABB RAPID alternative" - "FANUC programming without teach pendant" / "FANUC LR Mate programming" - "KUKA / Techman / Yaskawa Motoman no-code programming" - "[brand] machine tending automation"

D. Bottom-of-funnel / comparison (buyer is choosing a vendor) — highest conversion, currently missing: - "Aurevix vs Wandelbots" - "Wandelbots alternative" / "TracePen alternative" - "Micropsi /

Augmentus alternative” - “best no-code robot programming software” - “best robot programming software for [machine tending / pick and place]”

E. Application/use-case (buyer has a specific task) — build a page per application: - “machine tending automation software” *(in your meta)* - “pick and place automation no-code” *(in your meta)* - “pneumatic gripper automation” *(you have the article)* - “robotic inspection / quality automation” - “palletizing automation no-code”

The resource-hub strategy (you’re already doing this — scale it)

Your `/resources/` cluster (VLA guide, teach-pendant-vs-video, UR-without-code, programming-cost, gripper guide) is exactly right. Each article (a) ranks for a problem-aware query and (b) is *citation-friendly for LLMs*. Expand the cluster along the intent map above. Priorities to add next: 1. **“Aurevix vs Wandelbots” and “Wandelbots/TracePen alternative”** (high-intent, low competition, and LLMs love comparison content). 2. **One page per robot brand** (“[Brand] no-code programming”) — high-intent, and the brands are searched constantly. 3. **One page per application** (“machine tending,” “palletizing,” “inspection”).

On-page & technical SEO

- **Titles & H1s:** keep them benefit + keyword (“No-Code Cobot Programming from Video” is good). Ensure every resource page has one clear H1 and a descriptive title.
- **Internal linking:** link every resource article *to* the relevant brand/application page and *to* the demo CTA. Build topical authority by interlinking the cluster.
- **Page speed & mobile:** confirm the marketing site is fast and mobile-clean (your buyers research on phones; LLM crawlers also penalize slow/JS-heavy pages — see Part 3).
- **Keep citing sources** (Standard Bots, Konica Minolta, Precedence Research). It helps SEO credibility *and* GEO (LLMs trust cited content).
- **Sitemap & robots:** ensure the sitemap includes all resource/brand/application pages and that robots.txt allows AI crawlers (critical for Part 3).

Part 3 — GEO: getting recommended by ChatGPT, Claude & Perplexity

This is the part you specifically asked about. When a manufacturer asks an AI “*what’s the best way to program my robots without an engineer?*” or “*alternatives to hiring a robot integrator,*” you want **Aurevix named in the answer.** That’s Generative Engine Optimization (GEO), and it’s a distinct discipline from SEO.

Why it matters now: AI search engines are estimated to handle on the order of 12–18% of English informational queries as of early 2026, up from under 2% a year earlier — a steep curve. Crucially, only a small share of domains (~11–12%) get cited by *both* ChatGPT and Perplexity, so there’s a real early-mover advantage in a niche category like yours. (Figures are from 2026 industry GEO reporting — directional, not precise.)

GEO and SEO reinforce each other: weak SEO (slow site, thin content, low authority) won’t get cited no matter how well-structured your FAQ is. So Part 2 is the foundation; this is the layer on top.

The five GEO levers, in priority order

1. Entity clarity — make "what Aurevix is" unambiguous and extractable. LLMs build an internal "entity" for your brand. Make it crisp and consistent *everywhere* (site, LinkedIn, directories, press): > *Aurevix (by Agentic Convergent) is a no-code platform that programs industrial cobots from a video demonstration. It extracts task intent, simulates the plan, and exports native controller code for Universal Robots, ABB, FANUC, KUKA, Techman, and Yaskawa — without a teach pendant, custom code, or a robotics engineer.* Use that same one-sentence definition as your meta description, your LinkedIn "about," your G2/Capterra description, and the first line under your H1. Consistency across the web is what lets an LLM state confidently what you do.

2. Q&A and comparison content — the formats LLMs quote. - Your **FAQ is excellent** for this — extend it. Add the exact questions buyers ask AI: "What's the best no-code robot programming software?", "How do I program a robot without an integrator?", "Is there an alternative to Wandelbots / TracePen?", "Can I program a UR robot from a video?" - Build the **comparison pages** from Part 2.D. LLMs disproportionately cite head-to-head comparisons when users ask "X vs Y" or "best X." A clean, factual "Aurevix vs Wandelbots vs traditional integration" table is exactly what gets pulled into an answer. Keep it *fair and accurate* (LLMs and readers punish obvious bias). - Lead each answer with the **answer first**, then the explanation (the "inverted pyramid" — LLMs extract the lead sentence).

3. Structured data / schema markup. Add JSON-LD schema so crawlers extract you cleanly: - **`FAQPage`** schema on the FAQ (high-value — feeds AI answers and Google AI Overviews directly). - **`SoftwareApplication`** / **`Product`** schema for Aurevix (name, description, category, operating-system/robot compatibility, offers). - **`Organization`** schema for Agentic Convergent (logo, sameAs links to LinkedIn, founders). - **`Article`** schema on every resource post (author, date, headline). Schema-rich pages are cited more often by generative engines — it's one of the highest-leverage technical changes.

4. Crawler access + `llms.txt`. - **Confirm robots.txt allows AI crawlers** — GPTBot (OpenAI), ClaudeBot (Anthropic), PerplexityBot, Google-Extended. If these are blocked, you're invisible to those engines regardless of content. (AI crawlers like GPTBot reportedly crawl far more frequently than Googlebot, so technical changes propagate fast.) - **Add an `llms.txt` file** at the site root — an emerging standard that points AI crawlers to your most important pages (definition, how-it-works, comparison, FAQ, pricing). Cheap to add, signals priority. - **Verify your site in Brave Webmaster Tools** — relevant for Claude's web visibility. - **Make sure key content isn't JavaScript-only.** AI crawlers struggle with JS-rendered marketing pages; ensure your core definitions, FAQ, and comparison content are in the server-rendered HTML (your fetched page reads cleanly, which is a good sign — keep it that way as you add the console links).

5. Off-site brand signals — get cited by sources LLMs already trust. LLMs synthesize from across the web, not just your site. Build presence where they look: - **Directories/marketplaces:** G2, Capterra, SourceForge, robotics-specific directories. (These rank well and are frequently cited for "best [category] software" queries.) - **"Best no-code robot programming" roundups and listicles:** pitch yourself into them; they're exactly what gets quoted for "best X" prompts. - **Press & robotics media:** The Robot Report, RoboticsTomorrow, Automate-style coverage — even small mentions create the cross-web "brand signal" that makes an LLM confident enough to name you. - **Wikipedia/Wikidata entity** (eventually, once you have notability/coverage) — a strong entity anchor. - **LinkedIn:** an active, consistent company presence reinforces the entity. - **Comparison-site presence:** when someone writes "Wandelbots alternatives," you want to be on that list.

How to measure it (so you know it's working)

- **Manual tracking (free, do this weekly):** ask ChatGPT, Claude, Perplexity, and Google AI Overviews your top 10 buyer prompts ("best no-code robot programming," "alternative to Wandelbots," "program a UR robot from video," etc.). Log: date, engine, prompt, were-you-cited

(y/n), position. A simple spreadsheet. **Start with Perplexity** — it has the shortest feedback loop (results in a few weeks) and is the most citation-transparent.
- **Watch referral traffic** from chatgpt.com, perplexity.ai, etc. in analytics.
- **After ~3 months,** if manual tracking shows traction, consider a paid AI-visibility monitor (Profound, and others) to track citations across engines automatically.

GEO priority sequence (do in this order)

1. **Lock the entity definition** (one sentence, everywhere) — a day of work, foundational.
2. **Add FAQ + Product + Organization schema** — high leverage, low effort.
3. **Confirm AI-crawler access + add `llms.txt`** — technical, fast to propagate.
4. **Ship the comparison pages** ("Aurevix vs Wandelbots," "Wandelbots/TracePen alternative," "best no-code robot programming") — highest-intent, most-cited.
5. **Get into 3–5 directories + 1–2 roundups** — off-site signals.
6. **Track weekly in Perplexity, expand to ChatGPT/Claude** — measure and iterate.

One-page action summary

Website (this month): 1. Add **"Try the live demo"** (the console, Safe Demo Mode) as a frictionless path next to "Request Demo." 2. **Name the Automation Passport** and add a deploy-readiness/safety section. 3. Put the **ROI calculator** on the marketing site as a lead magnet. 4. Get **named design-partner proof** as attribution is approved.

SEO (this quarter): 5. Build **comparison pages** (vs Wandelbots / TracePen alternative / best-in-category). 6. Add **one page per robot brand** and **per application**, interlinked with the resource hub.

GEO (this quarter, in parallel): 7. **One-sentence entity definition** everywhere; **FAQ + Product + Org schema**; `llms.txt` + confirmed AI-crawler access; **directory/roundup presence**; **weekly citation tracking** starting on Perplexity.

Note on sourcing: GEO adoption figures and tactics above are drawn from 2026 industry reporting and are directional. The competitive details (Wandelbots' TracePen hardware approach, funding, multi-brand positioning) are from current company profiles and robotics press. Treat the numbers as orientation, not precision, and re-check before quoting them externally.
